FOREWORD

This is the 1st revision of the INIS/ETDE Joint Thesaurus. It contains 20 953 valid descriptors and 8 600 forbidden terms. It was last updated in December 2003.

The Joint Thesaurus contains the controlled terminology for indexing all information within the subject scope of both INIS (International Nuclear Information System) and ETDE (Energy Technology Data Exchange) information systems. The terminology is intended for use in subject description for input or retrieval of information in those systems.

The original basis of the terminology found in this thesaurus was the 1969 edition of the EURATOM Thesaurus. The structure subsequently given to that terminology was the result of a systematic study performed by subject specialists. Further expansion of the thesaurus terminology was done by ETDE to incorporate information on all forms of energy.

The Joint Thesaurus is the result of continued editing carried out in parallel to the processing of the INIS and ETDE databases. Identification of errors as well as suggestions for improvements to the present document are welcome. Comments should be addressed to either the INIS Thesaurus Specialist:

About ETDE

The Energy Technology Data Exchange (ETDE) is a consortium of countries that share energy science and technology information through ETDE's Energy Database and ETDE World Energy Base (ETDEWEB). ETDE was established as an Implementing Agreement in 1987 under the auspices of the International Energy Agency (IEA) and collaborates with other IEA entities as appropriate. A current list of ETDE member countries may be found at http://www.etde.org/abtetde/country.html. ETDEWEB is accessible to persons in ETDE member countries at http://www.etde.org/etdeweb/. Expected in 2004, developing countries approved by ETDE's Executive Committee will also be permitted access.

ETDE's focus is to cover subjects of greatest interest to the IEA and ETDE's international audience of database users. The information covered includes such important topics as environmental aspects of energy production, consumption, and use; energy efficiency and conservation; energy policy; renewable energy sources; end-use technology; fusion, fossil, and nuclear energy; and advanced energy systems. Coverage also includes the basic sciences that support energy R&D, such as aspects of chemistry, engineering, environmental sciences (with emphasis on global climate change), physics, biomedical sciences, materials science, computer science, mathematics, and instrumentation related to energy technology.

About the IEA

The International Energy Agency (IEA) is the energy forum for 26 countries. IEA member governments are committed to taking joint measures to meet oil supply emergencies. They also have agreed to share energy information, to co-ordinate their energy policies and to co-operate in the development of rational energy programmes. These provisions are embodied in the Agreement on an International Energy Programme (IEP), which established the Agency in 1974. ETDE is one of the more than 40 Implementing Agreements under the IEA.

About INIS

INIS is the world's leading information system on the peaceful uses of nuclear energy. The acronym INIS stands for International Nuclear Information System. INIS is operated by the International Atomic Energy Agency in collaboration with its Member States and co-operating International Organizations. INIS provides a comprehensive information reference service for literature in nuclear science and technology. To do this, INIS processes most of the world's scientific and technical literature that falls within its subject scope. The subject scope was developed to respond to the information needs of the international community in the areas of the IAEA's interests and activities covering the peaceful uses of nuclear science and technology.

Organizations participating in INIS may obtain reasonable quantities of the Joint Thesaurus on application to:

About the IAEA

The International Atomic Energy Agency (IAEA) is the world's intergovernmental forum for co-operation in peaceful uses of nuclear energy. It was founded in 1957 in accordance with a decision of the General Assembly of the United Nations. Its Statute states that "The Agency shall seek to accelerate and enlarge the contribution of atomic energy to peace, health and prosperity throughout the world. It shall ensure, so far as it is able, that assistance provided by it or at its request or under its supervision or controls is not used in such a way as to further any military purpose."

CONTENTS

PREFACE

"A thesaurus is a terminological control device used in translating from the natural language of documents, indexers or users into a more constrained 'system language' (document language, information language)". It is also "a controlled and dynamic vocabulary of semantically and generically related terms which covers a specific domain of knowledge". The Joint Thesaurus fits this definition adopted by UNESCO.[1]

The domain of knowledge covered by the Joint Thesaurus includes physics (in particular, plasma physics, atomic and molecular physics, and especially nuclear and high-energy physics), chemistry, materials, earth sciences, radiation biology, radioisotope effects and kinetics, applied life sciences, radiology and nuclear medicine, isotope and radiation source technology, radiation protection, radiation applications, engineering, instrumentation, fossil fuels, synthetic fuels, renewable energy sources, advanced energy systems, fission and fusion reactor technology, safeguards and inspection, waste management, environmental aspects of the production and consumption of energy from nuclear and non-nuclear sources, energy efficiency and energy conservation, economics and sociology of energy production and use, energy policy, and nuclear law.

The terms in the Joint Thesaurus are listed alphabetically, and with each alphabetic entry a "word block" containing the terms associated with the particular entry is displayed. In the word block, terms that have a hierarchical relationship to the entry are identified by the symbols **BT** and **NT**, for *Broader Term* and *Narrower Term*; those with an affinitive relationship are identified by **RT**, for *Related Term*; and those with a preferential relationship are identified by **USE** or **SEE** and the reciprocals **UF** and **SF**, for *Used For* and *Seen For*. (If more than one descriptor should be used, the designation **USE … AND …** is given with the forbidden term and **UF+**... appears by each of the preferred descriptors. If more than one descriptor should be considered, the designation **SEE … OR …** is used.) To attract the indexer's attention to the narrower terms in the word block, the reference indicators **"NT**" are printed in bold face, upper case type.

A non-descriptor sometimes refers to a descriptor that has Narrower Terms: users of the Joint Thesaurus should always refer to the word block of that descriptor to ensure that the most specific appropriate term is chosen. For all terms, only one broader term is shown. For those terms that have additional levels of broader terms (**BT2**, **BT3**, etc.), this fact is indicated by an asterisk, e.g. ***BT1**.

The dates printed after each descriptor show the month and the year when the term was introduced into either ETDE or INIS usage and hence its earliest possible appearance in the respective data base, provided its introduction occurred after 30 June 1975. If the descriptor is not followed by a date, it already existed in the thesaurus on 30 June 1975. In April 2000, a major addition of terminology from the Energy Technology Data Exchange (ETDE) thesaurus took place. These terms can be identified by the INIS date (Apr 2000). When searching for entries in the alphabetic listing, users should take note of the sort order, which is as follows:

space, asterisk *, dash (hyphen) -
Arabic numerals 0-9
Roman alphabet A-Z

It should be noted that numbers in sequence that include single digits as well as multiple digits will sort on the initial digit first. Thus, for example, the isotopes BORON 10 and BORON 19 appear before BORON 7 and BORON 9. In the same way, RUTHENIUM 100 will appear before RUTHENIUM 88. Finally, all terms in which the initial character is a number appear before the letter A.

CEA-ADL DUAL ALKALI PROCESS
INIS: Apr 2000; ETDE: Jun 1978
(Flue gas is passed through an absorption section where sulfur dioxide, chlorides, and sulfur trioxide are removed via contact with a solution of sodium salts. The sodium/sulfur salts are reacted with hydrated lime in a special 2-stage reactor to regenerate the sodium. Calcium/sulfur solids produced are separated from the liquor containing regenerated sodium compounds and disposed of. The regenerated liquor is recirculated to the absorption section.)

CHROMIUM-MOLYBDENUM STEELS

(Steels containing Cr and Mo as main alloying elements; Cr content is higher than Mo content. Until November 1983 this was a valid descriptor. From November 1983 until September 1994 the concept was indexed to CHROMIUM ALLOYS, MOLYBDENUM ALLOYS and the most specific appropriate term from the STEELS hierarchy.)

EXXON GASIFICATION PROCESS
INIS: Apr 2000; ETDE: Sep 1976
(Coal is reacted with steam in a fluidized-bed gasifier at 1500-1700 degrees F. To provide the necessary heat, a stream of circulating char is withdrawn from the gasifier and partially burned with air in a char heater to raise its temperature. The heated char is returned to the gasifier after separation from the flue gas. The product gas is a medium-btu gas suitable for methanation to sng.)

EXXON LIQUEFACTION PROCESS
INIS: Apr 2000; ETDE: Sep 1976
(Crushed coal is slurried with a recycle solvent, preheated to about 800 degrees F, and then pumped into the liquefaction reactor operating at about 2,000 P.S.I. Preheated hydrogen is also added to the reactor. The product from the liquefaction reactor is sent to the separation step where gas, naphtha, recycle solvent, distillate, and heavy bottoms are separated by distillation.)
